A;Title: Complete nucleotide sequence of the membrane form of the human IgM heavy chain.
A;Reference number: S14683; MUID:90332450; PMID:2115996
                                                                                                                                                                                                                                                                                                                                                A; Residues: 1-133 cKIP>
A; Experimental source: the sequence was determined from the differentiated gene
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
F; 15-98/Domain: immunoglobulin homology <INM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              83 FOGRUTITADESTSTAYMELSSLRSEDTAVYYCAKTGILGPYSSGWYPNSDYYYYGMDVW 142

```
This sequence represents the heavy chain variable region (VH) of a monoclonal antibody (MAb) which is immunoreactive with HIV glycoprotein 19910 and is capable of neutralising HIV. This sequence contains the leader sequence ferived from the mouse B72.3 heavy chain, and the human VH consensus sequence attached to the N-terminal of the b12 VH sequence. The DNA sequence contains a Kozak sequence for the control of VH expression. This sequence was amplified using the primer sequences given in AAT40889-92. A MAb containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 for a to concentration of less than 700 mg of antibody/ML, and binds mature determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection. (Updated on 16-OCT-2003 to standardise OS

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in virto virus infectivity assay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first polynuclectide encoding a heavy chain immunoglobulin amino acid sequence (which does not comprise the sequence represented by AAV98206) and a sequence; (b) inserting the first and second polynuclectide sequences into a host cell; (c) maintaining the host cell in conditions which allow the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell. The antibody is used for providing passive immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease and the patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV

in a biological fluid or tissue sample e.g. by radioimmunoassay, for producing anti-idiotypic antibodies which can be used for active homomisation and to screen human monoclonal antibodies to identify the with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV induced disease reduce the problems of significant host immune response to the antibodies associated with monoclonal antibodies of xenogeneic or chimeric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a fragment of an anti-human minimunodeficiency virus type 1 (HTV-1) antibody. The invention relates to a human whole immunoglobulin (Ig) molecule which immunoraects with HIV mature glycoprocein gp120 preferentially over HIV precursor glycoprotein gp120 preferentially over HIV precursor glycoprotein gp150 and which reduces HIV infectivity titre in an in vitro virus infectivity assay by 50%, at a concentration of less than 700 ng/ml. The antibodies are used as reagents for the diagnosis and
                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel human monoclonal antibodies which immunoreact with and neutralize human immunodeficiency virus useful for treating HIV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 GQRFEWMGWINPYNGNKEFSAKFQDRVTFTADTSANTAYWELRSLRSADTAVYYCARVGP

tield isolates and provide useful information regarding the field isolates and provide useful information regarding the immunocomperence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing anti-idiotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the HIV gpl20 and gp41 glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies derives from the fact that they are encoded by a human polyuncleotides derives from the fact that they are encoded by a human polyuncleotides sequence. Thus in vivo use of the monoclonal antibodies for diagnosis and immunotherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively administered antibodies of xenogeneic or chimeric derivation are utilized. An additional major advantage of the monoclonal antibodies described derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GORFEWMGWINPYNGNKEFSAKFODRVTFTADTSANTAYMELRSLRSADTAVYYCARVGP 120

The present invention describes a hybrid polypeptide (I) comprising: (a) a polypeptide motif containing a sufficient number of contiguous amino addressives from a polypeptide associated with a disease of protein aggregation or conformation to bind an aggregating form of the polypeptide or to a disease-associate conformer of the polypeptide or to a disease-associate conformer of the polypeptide or to a disease-associate conformer of the polypeptide or to a disease-associate conformer of the polypeptide or to a disease-associate conformer of the polypeptide or to a disease causing or infectious conformer of the polypeptide that is the source of the polypeptide motif compared to a benign form of the polypeptide. Also described: (1) a nucleic acid molecule encoding (1); (2) a vector of comprising the nucleic acid molecule; (3) a cell comprising the vector; (4) detecting enclied acid molecule; (3) a cell comprising the vector; (4) detecting cells that a disease of protein aggregation, in a sample; (5) a solid support comprising a plurality of polypeptides described with a disease of protein aggregation; (7) preparing a hybrid molecule with a disease of protein aggregation; (7) preparing a hybrid molecule with a disease of protein aggregation; (7) preparing a protein involved in the disease mentioned above; and (8) an anti-idiotype antibody that specifically binds to an infectious form of a prior protein; (1) has neutrinflammancory and antiarteriosclerric activities, and can be used in carebroprotective, antigarkinsonian, cytostatic, nephrotropic, cardiant, antificanmancory and antiarteriosclerric activities, and can be used in diagnosing or treating diseases of protein aggregation or conformation, such as Creutzfeldt-Jakob disease, scrapie and bovine spongiform encephalopathy, Alzheimer's disease, preditary systemic speciated with chronic inflammatory disease, immunoglobulin and methods of protein aggregation or spongiated with chronic inflammatory disease, hereditary secarity and protein aggregation or spongiated w
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        transthyretin gene, amyotrophic lateral sclerosis, Pick's disease, Parkinson's disease, Frontotemporal dementia, multiple myeloma, plasma cell dyscrasias, familial amyloidotic polymeuropathy, medullary carcinoma of thyroid, chronic renal failure, congestive heart failure, senile cardiac and systemic amyloidosis. Chronic inflammation, atherosclerosis or familial amyloidosis. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                      New motif-grafted hybrid polypeptides binding to the infectious form of a prion, useful for diagnosing or treating diseases of protein aggregation or conformation, e.g. amyloidosis, Alzheimer's disease, renal failure or diabetes.
                                                                                                                                                                                                                                                                                                                    Claim 37; SEQ ID NO 4; 115pp; English

ö The invention relates to a recombinant adeno-associated virus (rAAV) / Indiable or rAAV/ScEvX5 genome. The rAAV is useful for gene delivery, particularly in delivering antibody genes to target cells in mammals. The antibodies may be used to prevent and/or treat viral infections (particularly HIV), bacterial infections and other chronic disease states (e.g. cancer, rehumaroid arthritis, inflammation, fatal familial insomnia, kuru, Mad Cow Disease or Alpers syndrome). The present sequence represents the human monoclonal antibody (MAb) IgGibl2 heavy chain 61 GQRFEWMGWINPYNGNKEFSAKFQDRVTFTADTSANTAYMELRSLRSADTAVYCARVGP 120 61 GQRFEWMGWINPYNGNKEFSAKFQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGP 120 1 MEWSWVFLPFLSVTTGVHSQVQLVQSGAEVKKPGASVKVSCQASGYRFSNFVIHWVRQAP 60 New recombinant adeno-associated virus (rAAV)/IgG1b12 or rAAV/ScFvX5 genome, useful for preventing or treating viral infections (e.g. HIV) bacterial infections or other chronic disease states (e.g. cancer, MEWSWVFLFFLSVTTGVHSQVQLVQSGAEVKKPGASVKVSCQASGYRFSNFVIHWVRQAP 0; Gaps Query Match 100.0%; Score 793; DB 7; Length 476; Best Local Similarity 100.0%; Pred. Lymphocyte mRNA was converted to CDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. B.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the NAb regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AARA4244 neutralises HIV1 gpl20. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human monoclonal antibodies neutralising HIV - react with gp120 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy.

```
The sequences given in AAR75568-72 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The Fab's 3b1, 3b3, 3b4 and 3b9 have the same amino acid composition as MT4 but have randomised amino acids in the entire CDR1 and in four of the 18 amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of fallong of antibody per ml. They can be used to provide passive callon go of antibody per ml. They can be used to provide passive than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           82
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           23 LVQSGAEVKKPGASVKVSCQASGYRFSNFVIHWVRQAPGQRFEWMGWINPYNGNKEFSAK

                                                                                                                                                                                                                         This sequence represents the heavy chain variable region (VH) of a monoclonal antibody (MAD) which is immunoreactive with HTV glycoprotein gp120 and is capable of neutralising HTV. This sequence represents the sequence of clones b4 and b12. The MAD has the capacity to reduce HTV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 mg of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. This sequence forms the heavy AAM01273, AAM01275-76, AAM01293, AAM01296, and AAM01295 300. The MAD may be used for determining immunocompetence of a human anti-HTV antibody and

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human correlates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity corresponds of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first polynucleotide encoding a heavy chain immunoglobulin amino acid sequence complynucleotide encoding a light chain immunoglobulin amino acid sequence corresponds of sequence into a host cell; (b) inserting the first and second polynucleotide sequences into a host cell; (c) maintaining the host cell in conditions which allow the namino acid sequences encoded by the polynucleotides to be expressed to in the host cell; and (d) isolating the antibody comprising the host cell; The chain immunoglobulin amino acid sequences from the host cell. The clight chain immunoglobulin amino acid sequences from the host cell. The chain immunoglobulin amino acid sequences from the host cell. The antibody is used for providing passive
                                                                                                                                          ó
                                                                                                                                                                                                                                                                                                                                                                                                           61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease and to patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV in a biological fluid or tissue sample e.g. by radioimmunoassay, for producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV essent in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV-induced disease the problems of significant host immune response to the antibodies associated with monoclonal antibodies of especifically not claimed derivation. Note: The present sequence is specifically not claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 142

a numan whose inmugationing (19) mover that inmumoreacts with a numan whose inmugationing the control of less than specific or an unan whose instances and properties of the concentration of less than invitro virtue infectivity titre in an invitro virtue infectivity titre in an invitro virtue infectivity assay by 50%, at a concentration of less than 700 ng/ml. The antibodies are used as reagents for the diagnosis and immunocherapy of HIV induced disease. They are useful as neutralising field isolates and provide useful information regarding the immunocherapy of HIV induced disease. They are useful as neutralising control of the invention of screen human monoclonal antibodies to identify which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the immunocherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies sequence. Thus in vivo use of the monoclonal antibodies for diagnosis and immunocherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively administered antibodies which is a problem commonly encountered when monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies is described derives from the fact that they immune act into a unique determinant present on mature HIV glycoprotein gpl20.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                              The present amino acid sequence is the variable fragment (FV) of 3B3 antibody, isolated from a combinatorial phage display library constructed chome marrow RNA of an infected individual. It is used in a novel chimeric immunotoxin, that comprises an anti-gp120 antibody, having binding specificity to 3B3(FV) antibody, that is attached by a connector peptide to a cycotoxic molety, PB38 derived from P. aeruginosa. The chimeric immunotoxin is used in the treatment of HIV-1 infections. It is capable of specifically targeting and killing cells displaying HIV-1 the HIV viral load in the infected cells. It can also be used in establishing transformed cell lines derived from HIV-infected sources. The immunotoxins can also be used for detecting the presence or absence
                                                                                                                                                                                                                                                                                                                      ö

The sequences given in AAR75604-09 represent human Fab's comprising acids which comprise CDR1 have been randomised with 3 of the six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAB) which is capable of immunoreacting with, and neutralising HIV. The MAB's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per ml. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120
